

ABSTRACT OF THE DISCLOSURE

An active guidelines capability or component is linked to a computerized patient record system to integrate the use of clinical guidelines in the workflow of clinicians treating patients. Many healthcare institutions maintain sets of clinical guidelines

- 5 describing recommended treatment or analysis options for patients displaying sets of symptoms or for whom certain diagnoses have been made. The active guidelines feature adds an active guidelines tag to such clinical guidelines so that when the clinician accesses the clinical guidelines and wishes to follow the recommendation, the clinician merely has to click on a hypertext created from the tag which then transmits action
- 10 orders, also contained in the tag, to be transmitted to the computerized patient record system for implementation.
